

MeowPay: Ship a Slice

Build one real, thin slice of a fintech — end to end.

This is a short, hands-on exercise. Build something real, ship it, and tell us how you got there.

READ THIS FIRST

A small, correct, well-reasoned slice beats a large, shaky one — every time. We'd rather see a few things done with care, plus a clear note on what you skipped and why, than ten things half-wired.

SECTION 01 · THE TASK

MeowPay — the “send treats” slice

MeowPay is a (fictional) digital wallet for cats. Their humans top it up, and cats send each other **treats** (the currency). Under the whimsy it's an ordinary money-movement product — the shape of what we build for real.

Build the **transfer** flow as a single thin vertical slice: one cat sends treats to another, from a real backend through whatever UI a user needs to actually do it.

TIME

~4 hrs

Spend roughly **half a day**. Soft cap, not a race. Don't burn a weekend on this.

STACK

Yours

Ours is a **plus**; use whatever you're fastest in. The backend must be **real** — a running service with real persistence, not mocked.

AI AGENTS

Required

Use whatever you actually use — and **show us how**. This is how we work; we want your real workflow.

OUR STACK

Day to day we work in **Kotlin/Spring** on the backend, **Next.js / React** for web, and **Flutter** on mobile. Building your slice on any of these is a plus and shortens your ramp — but it's not required. Ship in whatever lets you move fastest.

ON USING AI

We build with AI coding agents every day. Using AI heavily is a *plus*, not something to hide — but we'll expect you to explain and defend every decision as your own.

SECTION 03 · SUBMISSION

How to submit

- 01 **Push to a public GitHub repo** under your own account. Verify it's genuinely public in an incognito window. No zips, gists, or private repos.
- 02 **Commit as you go** — don't squash into one commit. The history is part of what we read.
- 03 **Write a short README** — what you built, how to run it from a clean clone, and the decisions and trade-offs you made along the way.

WHAT WE'LL CHECK

The repo is public and runs from a fresh clone following your README.

The backend is real — a running service with real persistence and logic, not a UI over mocked data.

If you advance, we'll walk through the repo together — why you scoped it that way, and how you worked with AI. Build something you'll enjoy defending.
